

Linux Privilege Escalation - Quick Reference

zephyrx.in cheatsheets - sample entry

Enumeration

```
find / -perm -4000 -type f 2>/dev/null      # SUID binaries
sudo -l                                       # sudo rights for current user
getcap -r / 2>/dev/null                     # binaries with capabilities
cat /etc/crontab; ls -la /etc/cron.*         # scheduled jobs
find / -writable -type d 2>/dev/null | grep -v proc
```

Kernel & OS

```
uname -a; cat /etc/os-release                # version fingerprint
searchsploit "$(uname -r)"                  # known kernel exploits
```

SUID / Sudo GTFOBins-style abuse

```
./suid_binary -p                            # many binaries drop privs, -p keeps eu
sudo <binary> - check gtfobins.github.io first
```

Credentials at rest

```
grep -R -i pass /etc /opt /var/www 2>/dev/null
cat ~/.bash_history ~/.*history 2>/dev/null
find / -name '*.kdbx' -o -name 'id_rsa' 2>/dev/null
```

Reminder

This is a placeholder sample cheatsheet used to test the /cheatsheets page - swap it for a real one before shipping.
